

VERITAS Runtime Governability Engine

v6

VERITAS v6 introduces deterministic runtime governability inspection across high-consequence orchestration workflows.

The engine explicitly separates:

continuation admissibility, authority-state validity, commit-boundary eligibility, rollback viability, and bind integrity.

This architecture allows execution to remain operational while governance admissibility, rollback viability, or binding integrity progressively collapse.

The runtime progression evolves through:

FULLY_ADMISSIBLE → OPERATIONAL_WITH_GOVERNANCE_DEGRADATION → OBSERVABLE_BUT_INADMISSIBLE → COMMIT_INELIGIBLE → FAIL_CLOSED
